

Mod import-phpwiki

This mod is for importing from a **PhpWiki** dump file. **PhpWiki** is a wiki engine written in PHP. The first version, by Steve Wainstead, was in December 1999 and was the first Wiki written in PHP to be publicly released. See [phpwiki](#) for more details.

Install

See [Mods Admin](#) for instructions on how to install a Mod.

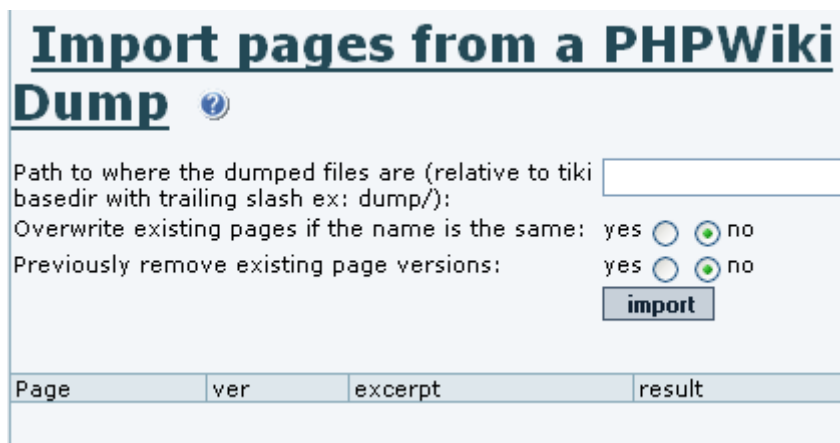

However, this mod is currently (July 2007) not well packed under mods.tiki.org, and you need to fetch it from sf.net cvs area:

http://tikiwiki.cvs.sourceforge.net/tikiwiki/_mods/features/import-phpwiki/tikiroot/

You need **tiki-import_phpwiki.php** set in your tiki root directory, and **tiki-import_phpwiki.tpl** under your templates directory.

Usage

Once installed, you will see a new option at "**Admin > Import PHPWiki Dump**"

The screenshot shows a web form titled "Import pages from a PHPWiki Dump". It includes a text input field for the "Path to where the dumped files are (relative to tiki basedir with trailing slash ex: dump/)", two radio button options for "Overwrite existing pages if the name is the same:" (yes/no), and two radio button options for "Previously remove existing page versions:" (yes/no). An "import" button is located below these options. At the bottom of the form is a table with four columns: "Page", "ver", "excerpt", and "result".

Page	ver	excerpt	result
------	-----	---------	--------

Have you installed it? Could you help us improve this documentation with your report on how you made it work? (and some [screenshot](#) of the output after import would be welcome)
