

## Module

In Tiki, a **module** is simply a box of content (which may or may not have "chrome" such as borders and title backgrounds). All side-column information of this site is presented through modules. The [Modules Admin](#) page is used to add modules to and manage modules in the module zones of a Tiki site.

Here's a screenshot:

Default Tiki page with the Menu module in the left column.

Some common uses for modules are to:

- Display [menus](#)
- Add special [features](#)
- Display custom information to users
- List most recent or most frequent actions or items

After adding modules, you can re-order them, assign [permissions](#) to them (so they appear only for specific user [groups](#)), or even allow them to be customized by specific users.

## Configuring and Displaying Modules

For site-wide module settings, click the **General** icon on the [Admin Panel](#) or Access <http://example.org/tiki-admin.php?page=general>.

These settings will apply to all modules on the site and are explained in more detail at [Module Admin](#).

There are two ways to configure and display individual modules:

### 1. Using the Admin Modules Panel

- Located at **Admin->Modules** or **tiki\_admin\_modules.php**
- Allows you to:
  - Set module parameters
  - Create custom modules
  - Place modules in the left or right column and, since [Tiki7](#), other areas like the page header and footer
- Documentation at [Module Admin](#)

### 2. Using [PluginModule](#)

- Allows you to:
  - Display a module in a page or within other features (like blogs, articles, etc.) besides the left or right columns
  - Also place module content inside of a user module
  - Set module parameters
- See [Index of Modules](#)

## Modules vs. Plugins

The distinction between **modules** and [plugins](#) is a little blurry. Technically speaking, modules are the *containers* and plugins are the *content*. However, the predefined modules included with the default Tiki installation contain plugins/content, but they are commonly called **modules**, too.
