Parameters

Plugin Manager error: includetpl plugin not found

Examples

Example 1

This code:

```
{includetpl filename="credits.tpl" values="var1:foo&var2:wohoo"}
```

Would produce on this site:

Theme: Fivealive-lite/Kiwi

If you use in your tpl the variables var1 and var2 (as in this example), they would get their values set in the corresponding plugin parameters above (foo and wohoo, correspondingly).

To use those values in a template you would use `{$_values.var1}` and `{$_values.var2}` in your Smarty code.

Example 2 with a Wiki Page Template

You can also use a Smarty template in a wiki page like this:

```
{includetpl filename="tplwiki:Tpl Page Name" values="var1:foo&var2:wohoo"}
```

Make sure you give your page `tiki_p_use_as_template` permissions and make it only editable by trusted users.
