

maketoc

This is deprecated, and buggy, and will be removed. Please use [Auto TOC](#) instead. 

maketoc stands for "Make a Table of Contents". It is used to automatically generate a table of contents from the headings (made with `!`, `!!`, `!!!`, etc.) or (`!#`, `!!#` ...) on the page that it appears on. It is useful for placing links to major sub-sections of a large document.

The tool [PluginToc](#) is something similar. It is used for [structures](#) of many pages. [PluginToc](#) will show a table of contents built from the titles of the pages within that structure of wiki pages.

Parameters

| Option | Description | Valid Values | Since |
|----------|--|-----------------------------------|-------|
| type | For backwards compatibility from older syntax: {maketoc:box} . Optional. | box | |
| maxdepth | Defines how many heading levels to include in the list. If 0 , then <i>all</i> headings will be included. Default = 0 | Numeric | |
| title | Title (heading) of the table of contents. Use title="" to have no title. Default = "Table of contents" Note: The title will be translated, if available. | Alphanumeric, enclosed in quotes. | 2.0 |
| showhide | Create a link that will collapse (that is, hide) the table of contents link. Default = n | y or n | |
| nolinks | Create the table of contents <i>without</i> links. Default = n (links <i>will</i> be created). | y or n | |
| nums | Specify if the items in the table of contents listing should be numbered. Default = n (use bullets instead of numbers). The style of the numbering can be customized to use "i, ii, iii" or others through css (see below) | y, n, force (same as y) | |
| levels | Specify which levels you want to see in the toc. Levels are integers (1 to 6) separated with comma. Ex: levels="2,3,4,5,6" to skip the first level | | 6.0 |

The jQuery Sortable Tables feature must be activated for the sort feature to work.

Also, only the lower case syntax may be used with maketoc as shown below. See [Plugin Syntax](#) for more information.

Example

This code:

```
{maketoc title="On this page" showhide="y"}
```

Would produce on this page:

Customizing the style of the numbering

You can override the style of the automatic numbering of the headings with CSS (cascading style sheets). Something like

```
.wikitext ol {list-style-type: lower-roman;}
```

This can be added to the end of the stylesheet you're using, or put in a custom.css stylesheet in the directory of your theme.
