## Plugin TrackerToggle

Introduced in [Tiki7](#)

This [wiki plugin](#) utilizes jQuery to toggle the visibility of an HTML element (like a div) depending on the value of a field. This plugin can be used in [Pretty trackers](#) (but it is not meant to be used with [pluginLIST](#)). This plugin permits [Display logic](#).

### Parameters

Plugin Manager error: trackertoggle plugin not found

### Note

- Category needs categId not categName to match
- If you use a field more than once in a template (e.g., `{f_180}`) only the first one on the page will be functional
- Only one plugin TRACKER of the same trackerId may appear on the page
- Only fields with a text value or checkbox (y/n) are functional prior to [Tiki11](#)

### Examples

#### Radio buttons

This code will show the div *success* only if the field 206 has the value "Show". When the field is not set yet, the div is not displayed.

```
{DIV(id="success")}Congratulations! The "success" div now shows.{DIV} {trackertoggle fieldId="206" value="Show" visible="y" id="success"} {f_206}
```

Result:

**You do not have permission to insert an item**

#### Show only if checkbox is checked

This code will show the div 'checkbox' only if the checkbox is checked. When the box is not checked, the div is not shown

```
{DIV(id="checkbox")}The checkbox div{DIV} {trackertoggle fieldId="180" value="y" visible="y" id="checkbox"} Checkbox: {f_180}
```

#### Show unless checkbox is checked

Will show the div until the checkbox is checked.

```
{DIV(id="checkbox")}The checkbox div{DIV} {trackertoggle fieldId="180" value="y" visible="n" id="checkbox"} Checkbox: {f_180}
```
